

Adaptive sonar transmission for changing Indian waters

SeaNergy senses the medium, solves the acoustic trade-off, and generates the waveform that preserves useful range with the best feasible resolution.

What we can do now

- Read four environmental channels
- Run four waveform families
- Explain every solver decision
- Log and export each ping
- Operate offline on the vehicle

What the finished product achieves

- Automatic water-driven retuning
- Scope-verified low-distortion output
- Measured low-power endurance
- Sealed AUV payload integration

Deployment path

1 DDS/DMA scope proof 2 200 kHz tank campaign 3 sealed V2 pod and pressure test

Planning cost: INR 2,500-4,500 bench; INR 36,000 marine-ready estimate. Vendor quotations remain open.

Reality boundary: the payload has not yet been tested in water. Water, power, distortion, and endurance figures are estimates.
